

Our family works with sheep since 2004.

we started with merinos at the beginning, then gradually changed to meatsheep, now selling prime lambs and suckers with using concentrated joining and lambing .

We have 60 hectare fenced paddocks and another 80-100 hectares where we have them grazing. The grain and haylage are grown on rented infields

„The lowlands of Hungary are mysterious lands, (their) crows froze in winter, they go mad during the summer. It seems like it's not the folks of Asia who came here but it's Asia itself who came here with its folks.” (Sinka István: Fekete bojtár-Black herdsman) (Black herdsman by István Sinka hungarian poet)

Our farm is located on one of the lands with the worst productivity and fertility in Hungary. It's kind of a sand land between River Duna and River Tisza . In Hungary usually we have the hottest summers and get the lowest rainfall. it's more and more exacting for the animals and also for farmers. Every year we strive to extend the grazing time, therefore we sow rye and triticale on the winter paddock, reducing the number of days spent in the sheepshed.

Why the White Suffolk?

I detected it in 2014, which was already the leading breed in Australia. I was looking for a white meatsheep that is in possession of/has great maternal traits, at the same time is suitable for the demands of our age concernig such as the strength of their body and carcass traits. Another important point (during picking the breed) was the animals' good performance under extreme weather conditions.

In 2015 I had the fortune to visit the Bundara Downs farm near Bordertown in South Australia; there, I could make sure of what I was assuming based on the pictures and videos. Incredibly proportionate/harmonious, muscled body structure (composition), excellent condition typified the animals in spite of the fact that the place they were rearing had the circumstances of a desert (like our farm does).

With the collaboration of our family, in 2017 our dream turned into reality: at the end of April the first lambs were born as a result of the embryo implant.

The flushing and freezing of the embryos were conducted/done by the Murray River Genetics of New Zealand, the implanting was done by the Intézményközi Kiskérődző Biotechnológiai Kutatócsoport. Both of them testified about their excellent professional competence and collaboration.

The donor animals were bought from the Bundara Downs farm in Australia.
